

Ontology-oriented resources from the National Center for Biomedical Ontology

Mark Musen and Nigam Shah
{musen, nigam}@stanford.edu

NCBO: Key activities

- We **create and maintain a library** of biomedical ontologies.
- We **build tools and Web services** to enable the use of ontologies and their derivatives.
- We **collaborate with scientific communities** that develop and use ontologies.

Of Current Interest

- ▶ **Webinar:** Webinar series takes summer break and will resume on Wednesday, Sept. 1, 10 AM (PST): Cecilia Arighi, Protein Information Resource
- ▶ **Recent Publication:** Jonquet, C, Musen, MA, Shah, NH (2010): Building a biomedical ontology recommender web service
- ▶ **Recent Release:** BioPortal 2.5 (June 7, 2010)
- ▶ **Call for Panels:** Panels due October 18, 2010, AMIA 2011 Summit on Translational Bioinformatics
- ▶ **NCBO - Public Talks - Subscribe**

Video

Learn about Biomedical Ontologies. Watch an introductory video.

Browse ontologies in BioPortal!

BioPortal allows users to browse, search and visualize ontologies.

Access all ontologies that are available in BioPortal: You can filter this list by category to display ontologies relevant for a certain domain (try selecting "Anatomy or Experimental Conditions" in the "Filter by category" menu below). You can also filter ontologies that belong to a certain group such as ontologies from the [OBO Foundry](#), or ontologies from the [Cancer Biomedical Informatics Grid \(caBIG\)](#). [Subscribe to the BioPortal RSS feed](#) to receive alerts for submissions of new ontologies, new versions of ontologies, new notes, and new projects. You can subscribe to feeds for a specific ontology at the individual ontology page. Add a new biomedical ontology to BioPortal using the Submit New Ontology link (you need to [sign in](#) to see this link).

SUBMIT ONTOLOGY	Submit New Ontology

Medical Subject Headings

Welcome to the NCO Bioportal

Use BioPortal to access and share ontologies that are actively used in biomedical communities. You can search for terms in ontologies (try typing "MeSH" in the "Search all ontologies" box in the left column), browse a list of ontologies in BioPortal (type "NCI Thesaurus" in the "Find an ontology" box in the middle column), search biomedical resources that we automatically annotated with ontology terms (try typing "MeSH" in the "Search resources" box in the right column). You can create ontology-based annotations for your own text, link your own project that uses ontologies to the description of those ontologies, find and create relations between terms in different ontologies, review and comment on ontologies and their components as you browse them. Sign in to BioPortal to submit a new ontology or ontology-based project, provide comments on ontologies or add ontology mappings.

VIEWS

Custom subsets of large ontologies

Views and Value Sets

- Users can contribute their derivatives of BioPortal ontologies,
 - which become first-class objects in BioPortal and can be used as all other ontologies are (e.g., as value sets)
- Recently added: **a view-extractor service**
 - Enables users to extract a subtree of an ontology in OWL

ANNOTATOR SERVICE

Using Ontologies to Annotate *Your* Data

Annotation as a Web service

Process textual metadata to automatically tag text with as many ontology terms as possible.

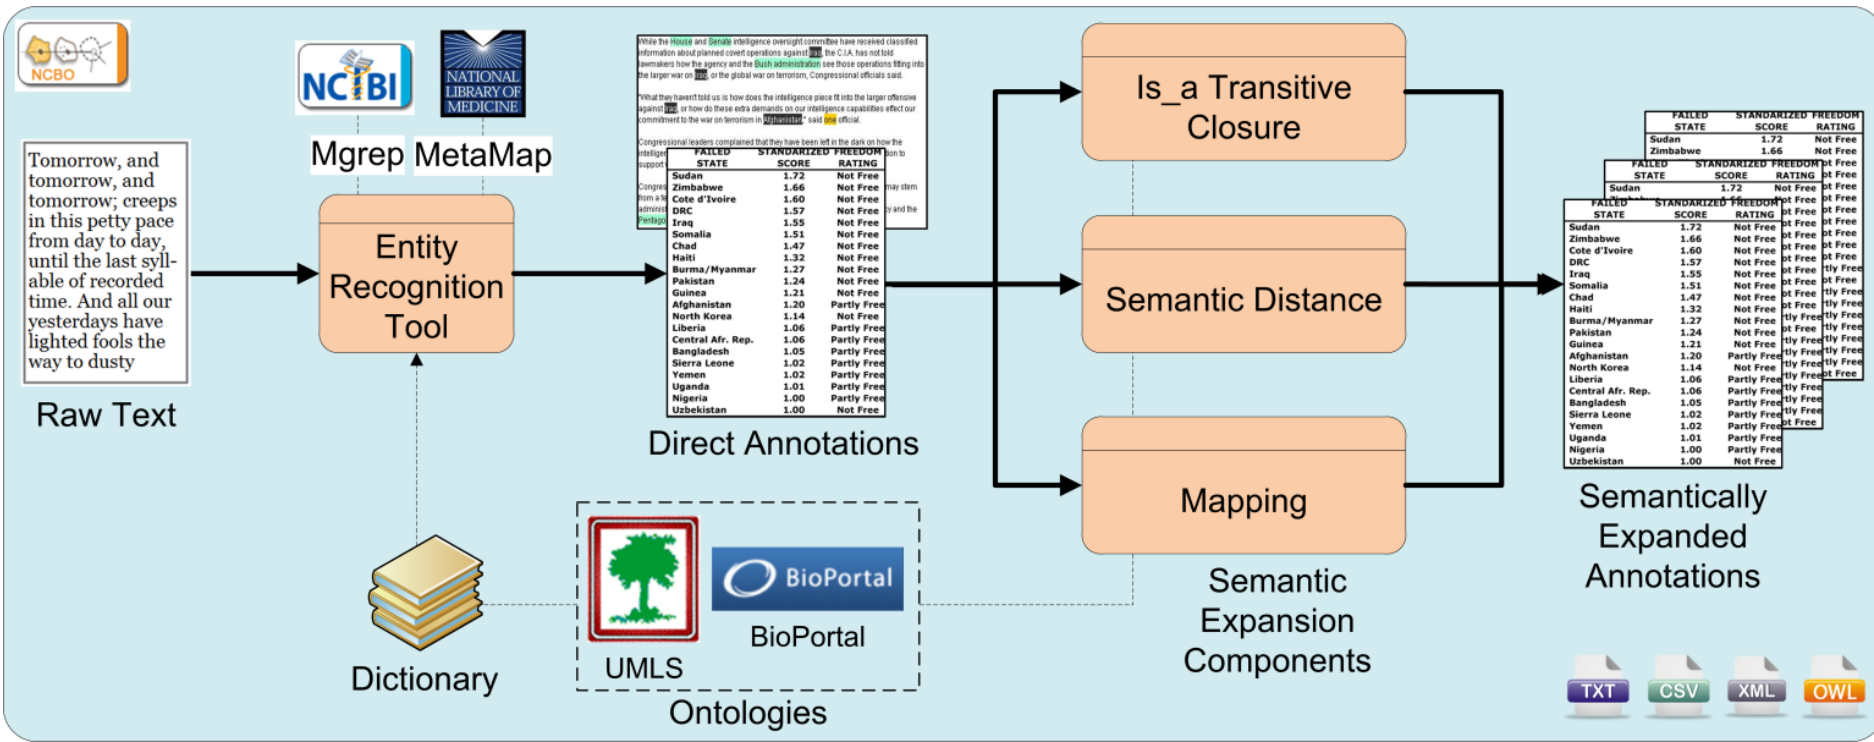

GDS Summary			
Accession:	GDS906 View Expression (GEO profiles)		
Title:	Bladder smooth muscle cell response to mechanical stretch		
DataSet type:	gene expression array-based (RNA / in situ oligonucleotide)		
Summary:	Expression profiling of cultured bladder smooth muscle cells subjected to repetitive mechanical stimulation for 4 hours. Chronic overdistension results in bladder wall thickening, associated with loss of muscle contractility. Results identify genes whose expression is altered by mechanical stimuli.		
Platform:	GPL96: Affymetrix GeneChip Human Genome U133 Array Set HG-U133A		
Citations:	Adam RM, Eaton SH, Estrada C, Nimgaonkar A et al. Mechanical stretch is a highly selective regulator of gene expression in human bladder smooth muscle cells. <i>Physiol Genomics</i> 2004 Dec 15;20(1):36-44. PMID: 15467014		
Sample organism:	Homo sapiens	Platform organism:	Homo sapiens
Feature count:	22283	Value type:	count
Series:	GSE1595	Series published:	07/25/2004
Last GDS update:	12/20/2004		

Expression, Expression of bladder, bladder, smooth, bladder muscle, muscle, smooth muscle, cells, mechanical, mechanical stimulation, stimulation, Chronic, results, bladder overdistension, associated, associated with, with, loss, genes, altered

Word Add-in to call the Annotator Service ?

The top row shows a code editor with a file explorer on the left containing files like 'CourtLine.pl', 'Demo_OBA.pl', and 'Efalizumab.pl'. The main window shows a Perl script with comments and code for a REST API endpoint: `POST => *$annotatorURL; $location/A-ww-Exec-GetAnnotations`. Below the code editor is an Excel spreadsheet with columns: Term Id, Term Name, Score, Ontology Id, Ontology Name, Start, End, H. The spreadsheet lists terms like 'Efalizumab' and 'Plaque' with their respective scores and ontology IDs.

The screenshot shows the NCBO Annotator web service interface. It includes a 'Text' input field with the text: 'The objective of the analysis was to assess the benefit/risk of efalizumab, a novel biologic agent indicated for the treatment of moderate-to-severe plaque psoriasis, by applying the SPC to data from randomized, placebo-controlled clinical studies of efalizumab'. Below the text are 'Ontologies' and 'Semantic Types' selection options. The 'Annotation statistics' section shows: 'Direct annotations generated from term recognition on the given text (MGRP): 16', 'Expanded annotations generated from mappings (MAPPING): 0', and 'Expanded annotations generated from the is_a transitive closure (ISA_CLOSURE): 0'. The 'Annotation Tag Cloud' shows 'Efalizumab' as the most prominent term.

The screenshot shows the BioNLP UIMA Component Repository website. The page title is 'BioNLP UIMA Component Repository'. It includes navigation links: 'BIONLP-UIMA HOME | DOWNLOAD | ABOUT US | BIONLP HOME'. The main content area is titled 'BioNLP UIMA Component Repository' and 'DOWNLOAD BIONLP-UIMA'. It describes the repository as providing UIMA wrappers for novel and well-known 3rd-party NLP tools used in biomedical text processing. A list of 'Analysis Engines' is provided: Gene Identification: ABGene, ABNER, LingPipe, KeX; Biomedical Term Recognition: NCBO Annotator Web Service; Mutation Identification: MutationFinder; Semantic Parsing: OpenDMAP; Sentence Detection: KeX LingPipe OpenNLP; Tokenization: Genia Tagger, LingPipe, Penn BioTokenizer. It also lists 'Collection Readers for corpora: Bio1 BioIE, Texas, Yapex' and a license notice: 'The BioNLP-UIMA Component Repository codebase is licensed under the GNU General Public License v2.0. Please note that the 3rd party resources may have different licensing restrictions.'

View Ontology Details

This tab shows records in public data sources that we have automatically annotated with the terms associated with the class Melanoma or its subclasses based on the textual descriptions of those records.

Resource	Description	Annotations
PharmGKB [Gene]	PharmGKB curates information that establishes knowledge about the relationships among drugs, diseases and genes, including their variations and gene products.	Annotations:7
WikiPATHWAYS	WikiPathways was established to facilitate the contribution and maintenance of pathway information by the biology community. WikiPathways is an open, collaborative platform dedicated to the curation of biological pathways.	Annotations:0
ResearchCrossroads	Centralizing scientific and medical funding data so that researchers gain recognition for their work and funders make better investments.	Annotations:124
Conserved Domain Database (CDD)	The Conserved Domain Database (CDD) contains protein domain models imported from outside sources, such as Pfam and SMART, and curated at NCBI. CDD contains over 12,000 such models and is linked to other NCBI databases, including protein sequences, bibliographic citations, and taxonomy.	Annotations:7
PharmGKB [Disease]	PharmGKB curates information that establishes knowledge about the relationships among drugs, diseases and genes, including their variations and gene products.	Annotations:0
DrugBank	DrugBank is offered to the public as a freely available resource. Use and re-distribution of the data, in whole or in part, for comment or purposes requires explicit permission of the authors and explicit acknowledgment of the source material (DrugBank) and the original publication.	Annotations:7
Reactome	A curated knowledgebase of biological pathways.	Annotations:0

Resource Index

PART-II

Use-cases based on ontology services

Sample user needs

- I need to restrict user input to a certain value set
- I need to extract the disease branch from SNOMEDCT
- I need to identify all terms mapped to UMLS CUI C0151779
- I need to code/annotate free-text with ontology terms
 - For data exchange, export to standard formats

Use-cases for users of i2b2

Aim 1: Integrate NCBO services in i2b2

- Preliminary results:
 - Export any ontology stored in BioPortal into the format used by i2b2's ontology cell
- Future Work:
 - Make the export code available as a service
 - Embed the extraction code into the i2b2 Ontology Cell to “pull” content
 - Ensure we have the latest versions of ontologies used by i2b2 and CTSA users (ICD9, ICD10, SNOMEDCT, RXNORM, LOINC, CPT)

Aim 2: Mappings for query federation

- Preliminary result:
 - Worked out the workflow for using mappings for query translation
 - Detailed discussions with the HOM and OpenMDR groups to define use-case and elicit requirements
- Future work:
 - Use BioPortal as the shared repository for inter terminology mappings
 - Tackle access, IP, performance, and institutional issues
 - Key features
 - ✓ Import outside mappings
 - ✓ Update mappings when versions change
 - ✓ Mechanism to curate mappings
 - Support proprietary curation and content

Using Mappings for query federation

Annotation Analytics

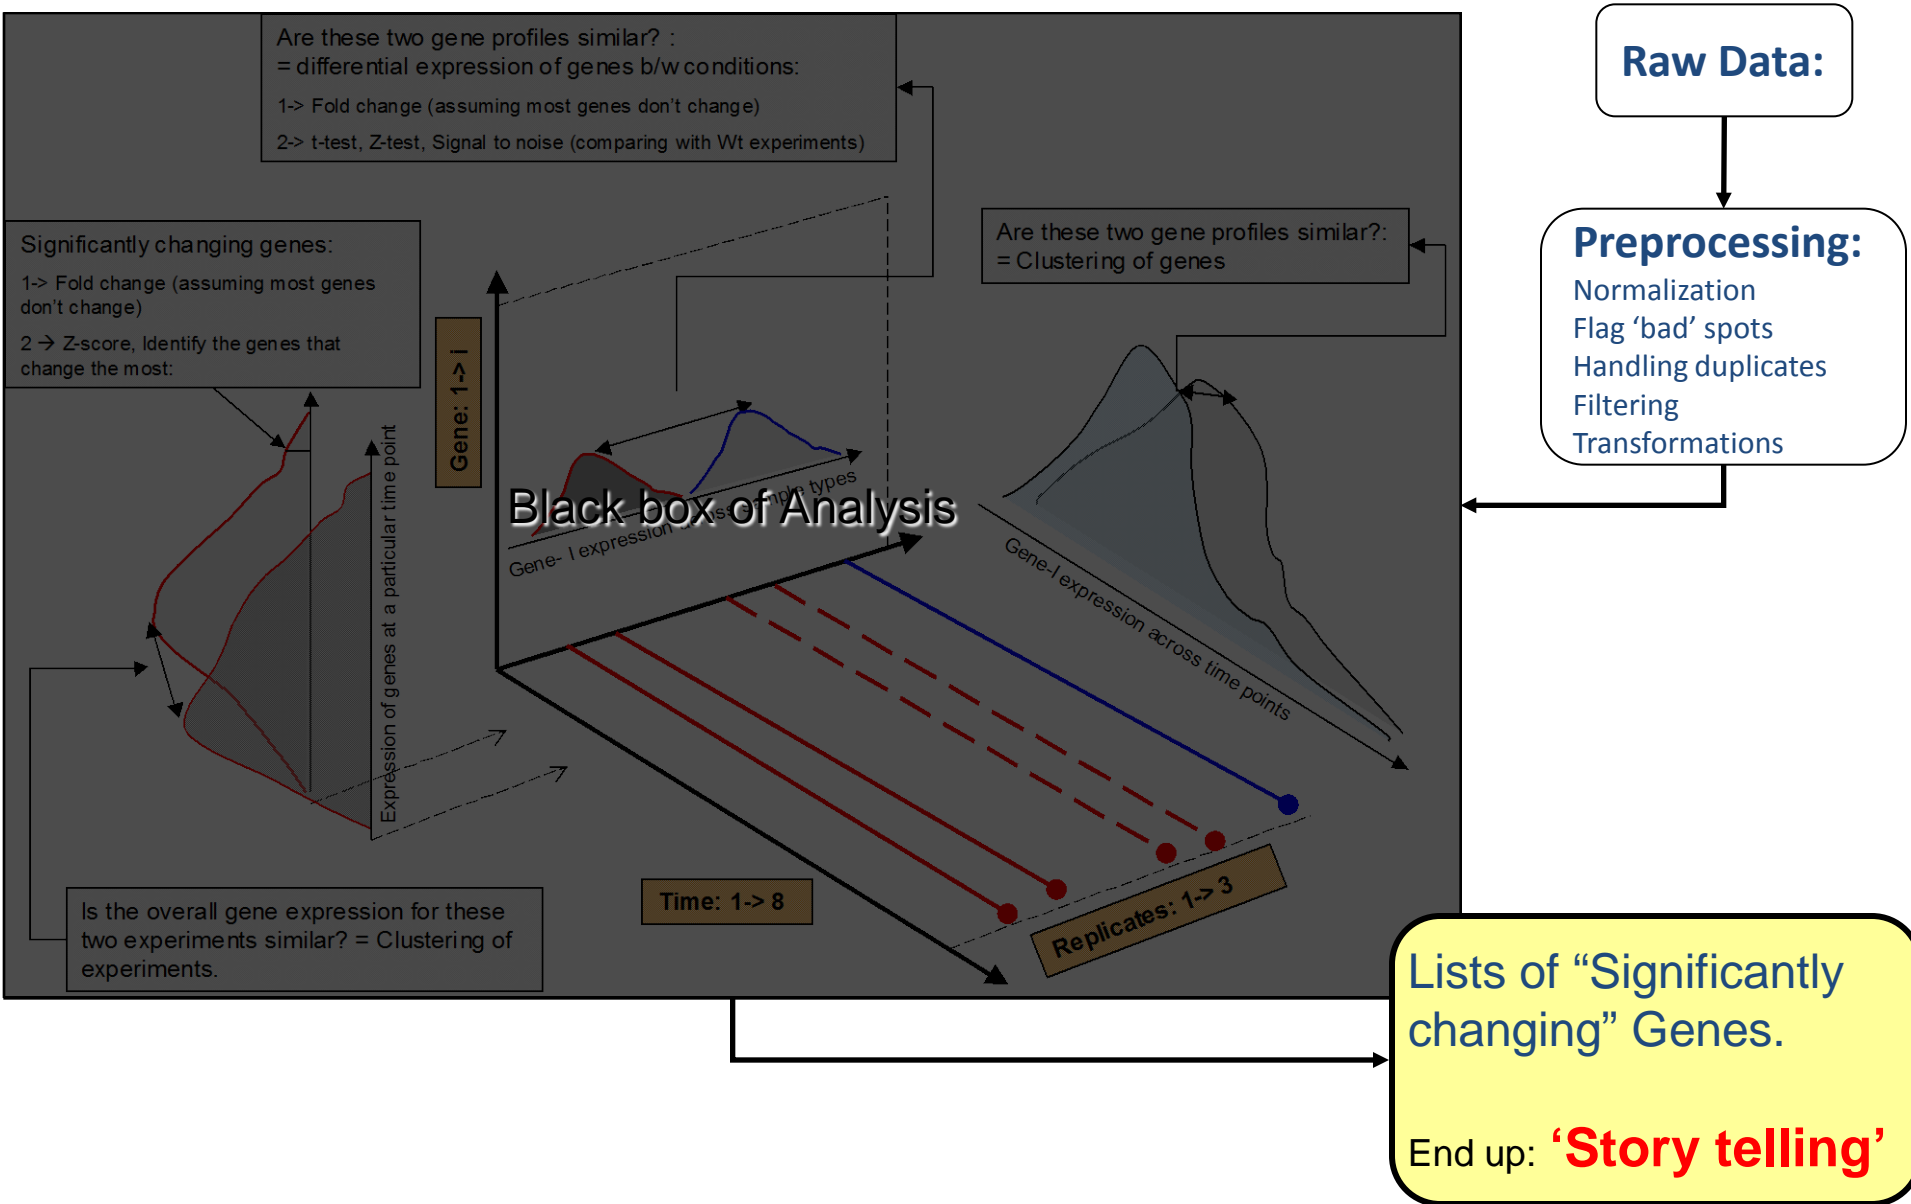

High throughput data

- “high throughput” is one of those fuzzy terms that is never really defined anywhere
- Genomics data is considered high throughput if:
 - You can not “look” at your data to interpret it
 - Generally speaking it means ~ 1000 or more genes and 20 or more samples.
- There are about 40 different high throughput genomics data generation technologies.
 - DNA, mRNA, proteins, metabolites ... all can be measured

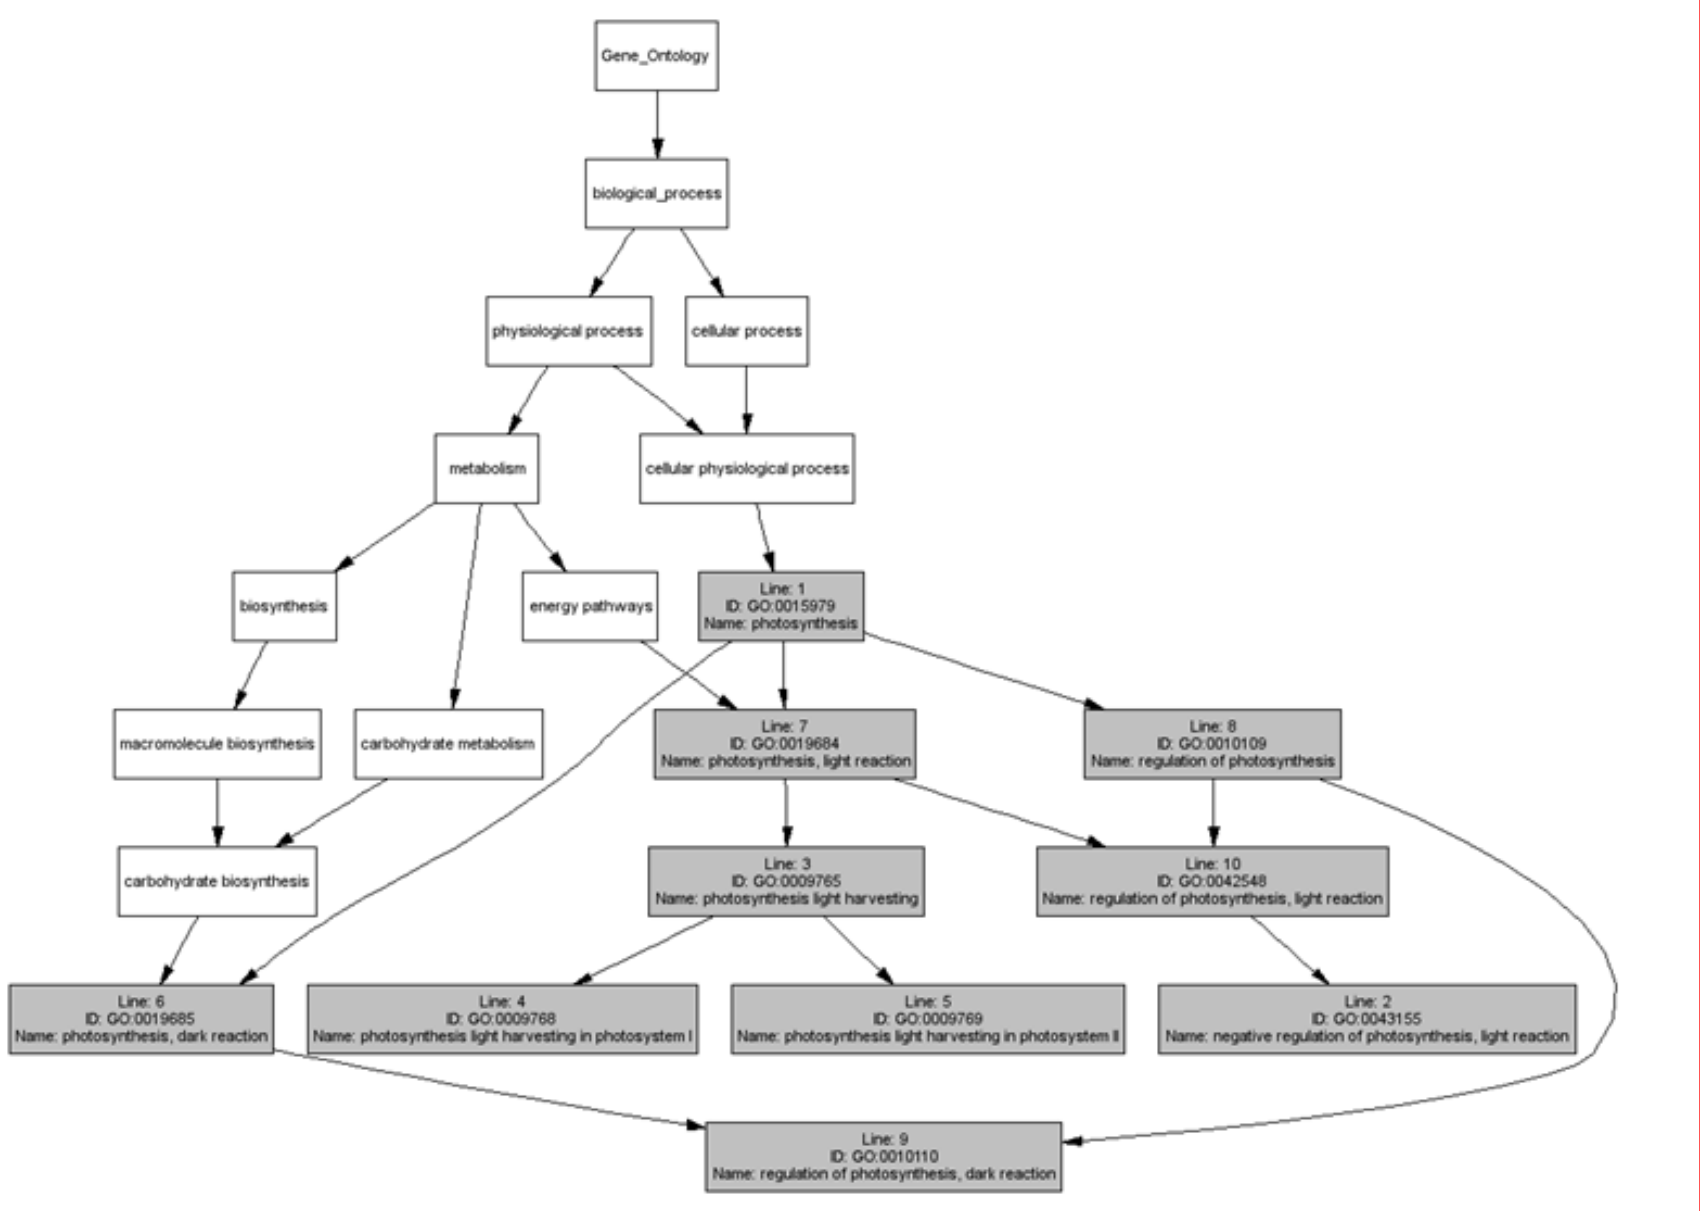

How do ontologies help?

- An ontology provides a *organizing framework* for creating “abstractions” of the high throughput data
- The simplest ontologies (terminologies, controlled vocabularies) provide the most bang-for-the-buck
 - Gene Ontology (GO) is the prime example
- **More structured ontologies** – such as those that represent pathways and more higher order biological concepts – **still have to demonstrate real utility.**

Analyzing Microarray data

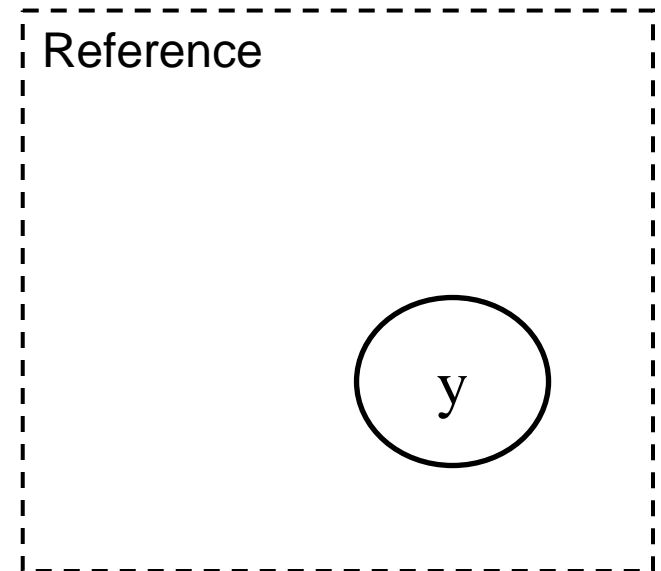

Gene Ontology (GO)

Generic GO based analysis routine

- Get annotations for each gene in list
- Count the occurrence (x) of each annotation term in gene list
- Count the occurrence (y) of that term in some reference set (whole genome?)
- P-value for how “surprising” is it to find x , given y .

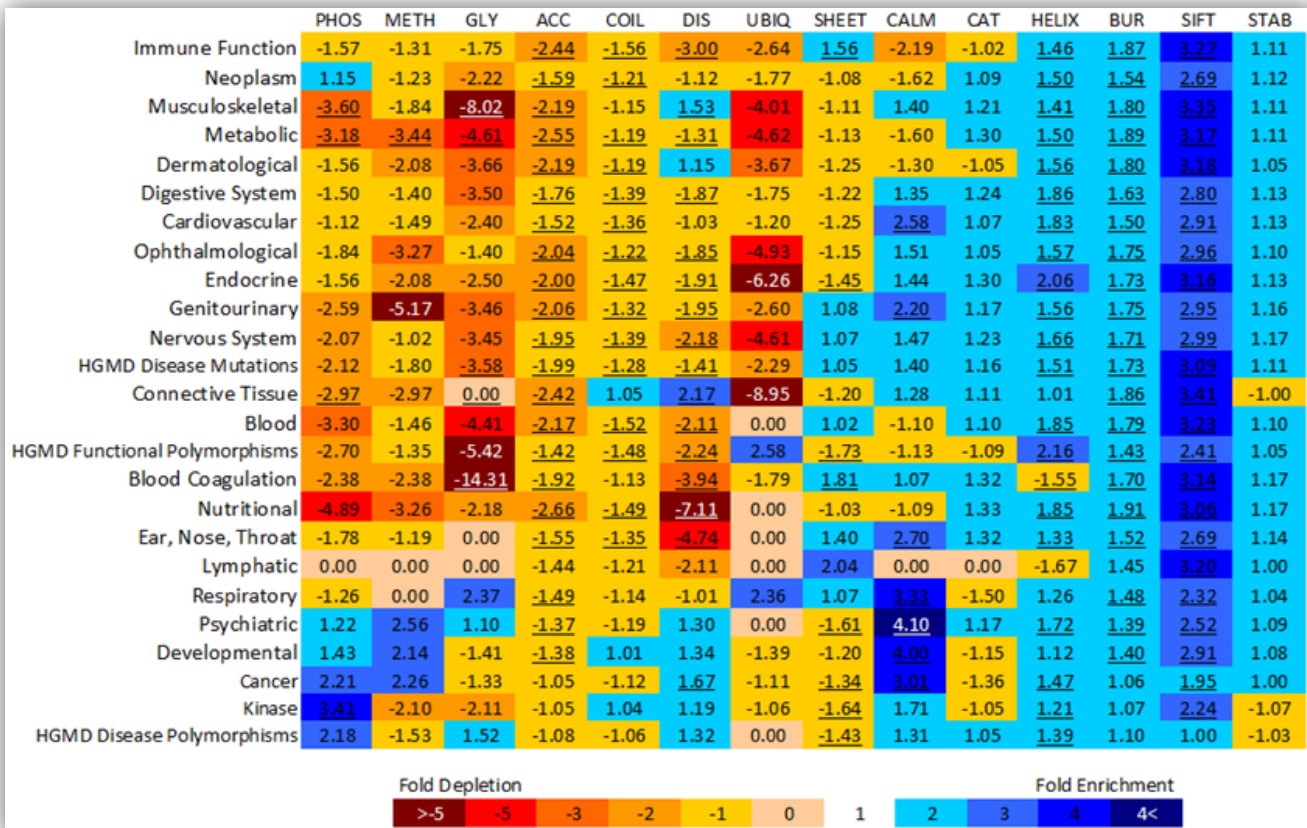

DIY Ontology Enrichment Analysis

Live Demo

Mutation enrichment

May have weak glycosidase activity towards glucuronylated steroids. However, it lacks essential active site Glu residues at positions 239 and 872, suggesting it may be inactive as a glycosidase in vivo. May be involved in the regulation of calcium and phosphorus homeostasis by inhibiting the synthesis of active vitamin D (By similarity). Essential factor for the specific interaction between FGF23 and FGFR1 (By similarity).
 The Klotho peptide generated by cleavage of the membrane-bound isoform may be an anti-aging circulating hormone which would extend life span by inhibiting insulin/IGF1 signaling (By similarity).

Data mining: Drug, Disease, Gene relationships

Extraction of Conditional Probabilities of the Relationships Between Drugs, Diseases, and Genes from PubMed Guided by Relationships in PharmGKB

Martin Theobald, Ph.D¹, Nigam Shah, M.B.B.S., Ph.D², and Jeff Shrager, Ph.D³

Example:

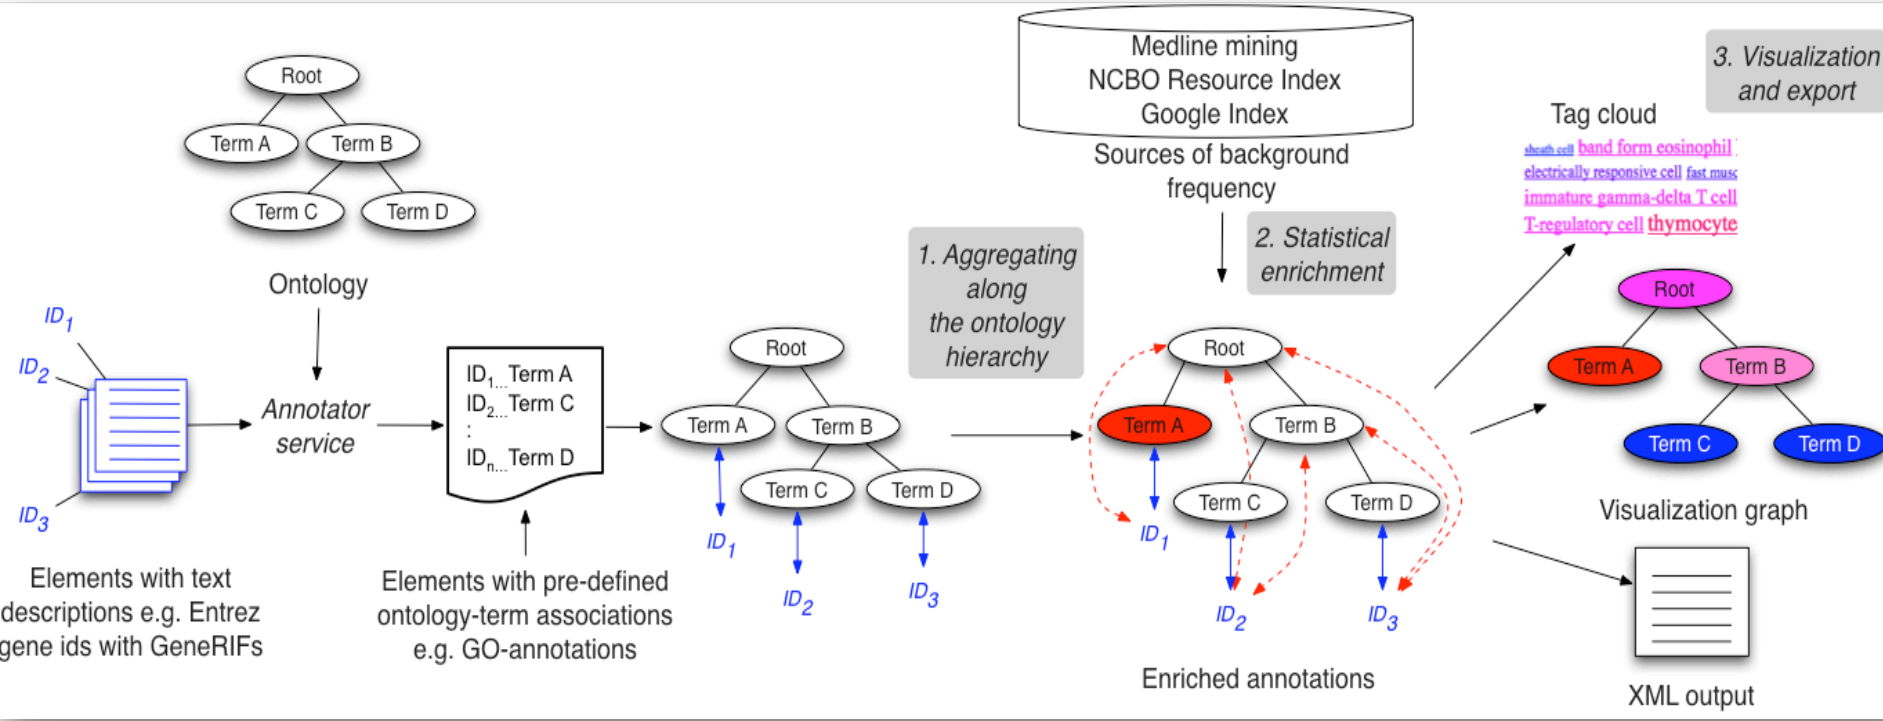

$$p(\text{salmeterol} \mid \text{Asthma, ADRB2}) = 0.07$$

$$p(\text{salbutamol} \mid \text{Asthma, ADRB2}) = 0.16$$

At best these are pointers to hypotheses:

- Stronger biomarker?
- More reported side effects?
- Simple recency?
- *Many interpretations are possible!*

An Ontology Neutral analysis tool

www.bioontology.org/wiki/index.php/Annotation_Summarizer

Sunday, 11/14, 3:30 – 5:00 PM, Session S07 in Lincoln West

Patient cohort analysis

Extended
criteria
kidney
transplant

$P(A | B, C \dots)$

Standard
criteria
Kidney
transplant

$P(A | B, C \dots)$

An “enrichment experiment” on EHRs

- Corpus of 90,000 EHR discharge summaries, progress reports, and other notes
- 233 Patients with discharge diagnosis, “Abdominal pain, not otherwise specified.”
- Identify other diagnoses (and their abstractions) that are “enriched” in this sample.

Data driven medicine

Data mining: Drug, Disease, Gene relationships

Extraction of Conditional Probabilities of the Relationships Between Drugs, Diseases, and Genes from PubMed Guided by Relationships in PharmGKB

Martin Theobald, Ph.D¹, Nigam Shah, M.B.B.S., Ph.D², and Jeff Shrager, Ph.D³

Example:

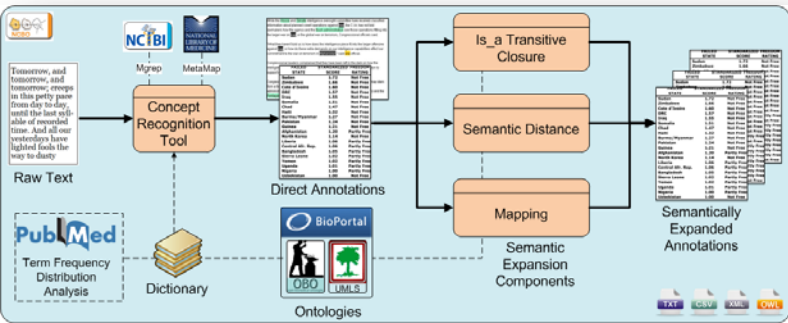

$$p(\text{salmeterol} \mid \text{Asthma, ADRB2}) = 0.07$$

$$p(\text{salbutamol} \mid \text{Asthma, ADRB2}) = 0.16$$

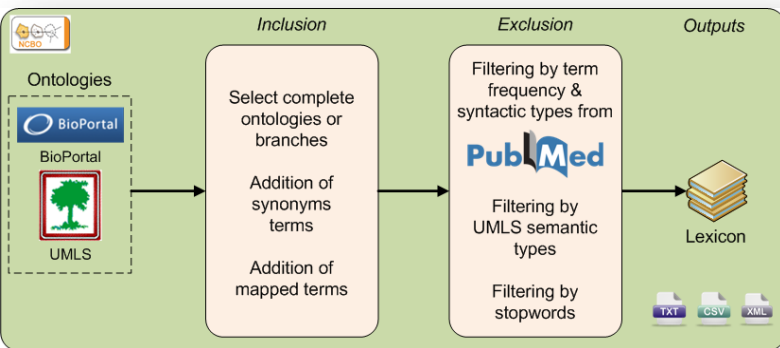

At best these are pointers to hypotheses:

- Stronger biomarker?
- More reported side effects?
- Simple recency?
- *Many interpretations are possible!*
